

Social Media Engagement Analysis – One Page Summary

Dataset Overview: The dataset contains 5000 social media posts with engagement metrics (likes, comments, shares, impressions, and watch time) along with attributes such as post type, content category, sentiment, device type, country, age group, and verification status. The objective of the analysis is to identify patterns that influence engagement and content performance.

Category	Key Insight
Content Performance	Video posts generate the highest engagement followed by images.
Best Content Category	Entertainment and lifestyle related posts perform the best.
Top Engagement Countries	Regions with higher social media usage show stronger engagement rates.
User Trends	Users aged 18–34 interact the most with posts.
Verified Accounts	Verified profiles receive higher engagement due to greater credibility.
Best Time for Impressions	Evening hours produce the highest impressions and interactions.
Device Impact	Mobile users show higher watch time compared to desktop users.
Sentiment Analysis	Positive sentiment posts generate the highest engagement.
Negative/Neutral Posts	Neutral posts receive moderate engagement while negative posts generally receive

Conclusion: Engagement on social media is strongly influenced by content type, posting time, user demographics, sentiment, and device usage. Strategies focusing on video content, positive messaging, mobile optimization, and evening posting times can significantly improve engagement performance.
